

Testing guide for initial setup

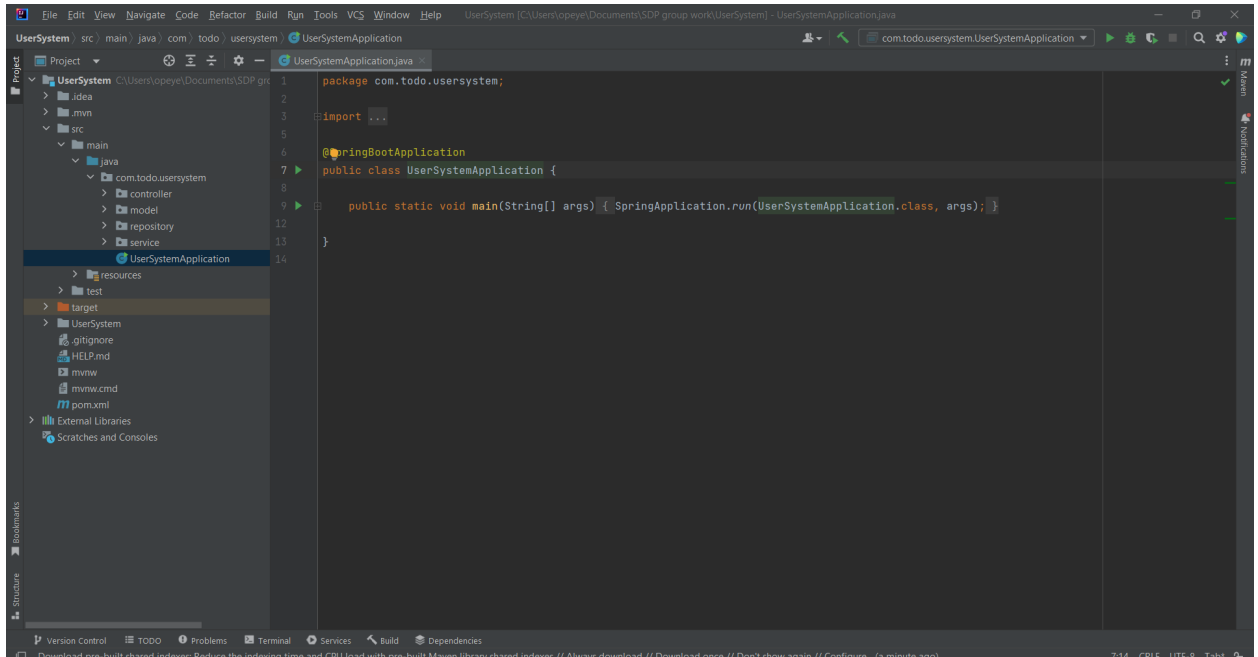

1. Start XAMPP

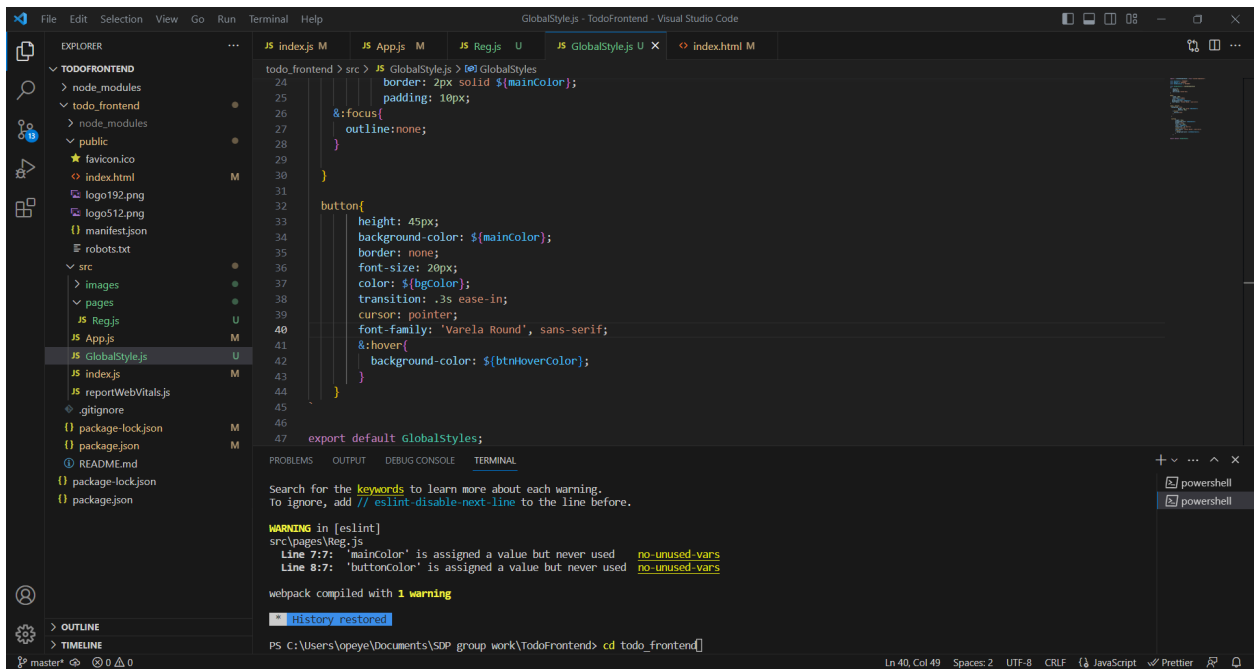

2. Start Apache and MySQL. Open Admin by MySQL

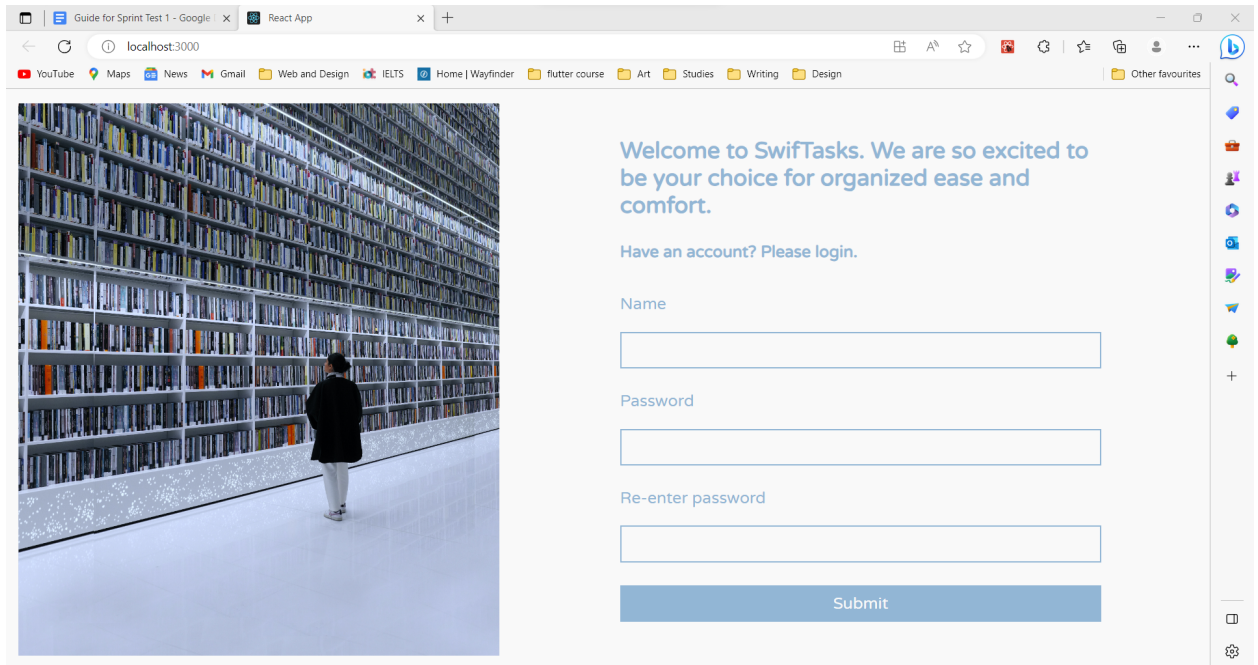

3. Click on New in the side bar, with the phpMyAdmin at the top
4. Create database and call it **todo_db**
5. Open IntelliJ and use it to open the UserSystem folder

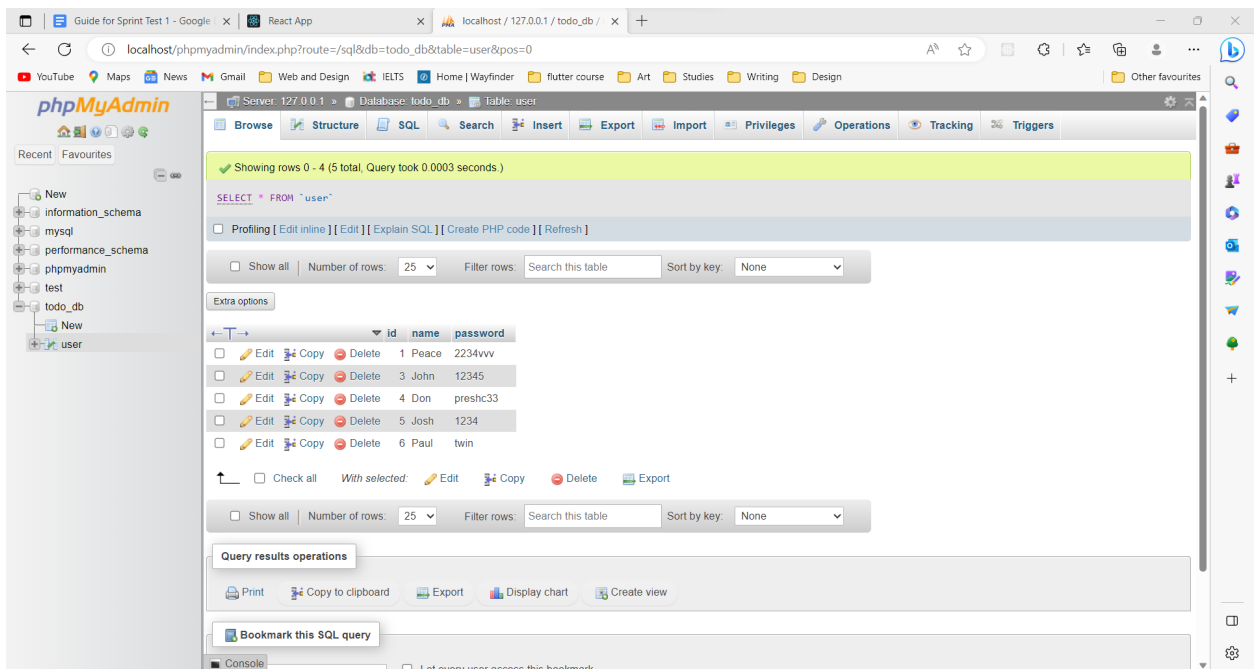

6. Navigate to UserSystemApplication and run the program
7. Open Visual Studio Code

8. Open TODOFRONTEND. Run `cd todo_frontend` to redirect the target to the main part. Then run `npm start`.

9. You should get the page above to run tests.
10. You can also check the phpmyAdmin page to see if it is updated like it is below. Just click on the **todo_db** database you created earlier, then click on the table **user**.

11. Enjoy testing! Good luck! Also, you might need this file for future iterations, so keep it secure.
